Recently purchased a Ic-208--my first mobile. The manual
suggest mounting the main unit under the front seat. I
wonder if anyone has mounted it that way, and how difficult it
is to here the speaker? Any thoughts on the subject would be
appreciated.

From: Matthew Wisz
Topic: 4 Message: 5

Personally,

I would not mount it under a seat. For one, trash, dust etc will be collected into the unit via the fan as well as any cords running under the seat may be damaged by seat movement. Second, though the speaker is can be just as loud no matter where you put it, I like to be able to hear the radio in my car too so mounting the speaker in a direct line of sight to me seems to work well. Or of course you could just by an external speaker....

6. Ic-208

Yahoo group: ic208h
Date: 2007-11-05 12:42:46 UTC
From: zapacitulll
Topic: 6 Message: 6

Hi There,

Recently i bought this radio and its been moded to do CB Band as well
it seems that it can handle it quite well at swr of 1.6 at 50watts (
on a dual band antenna) this test was only done for study purpose only
as it is illegal to transmit anything over 5 watts on cb.

I do know that the radio has a SWR fall back if unit gets hot and if
the SWR is high.. however one thing i kinda dislike about this radio
is the menus on it.. you get lost in it lol.

Any idea of how to make it easier on organizing it?

regards

8. New Guy says hello.

Yahoo group: ic208h
Date: 2007-12-20 19:48:20 UTC
From: Dave P.
Topic: 8 Message: 8

Hi, folks;

With the popularity of this radio I would have expected more members!

I'm a relatively new ham -- W1HRD since September. The first radio I bought was an IC-208, and used it as a base for several months before mounting it in a Jeep Cherokee.

I do have a question, though.
What good is assigning a bank letter to your saved memory channels if you can't scan on, say, a single bank? I set up mine as Public Service in one bank, local repeaters in another, but when I try to scan memories it's all or nothing.
Did I read the manual wrong?

Thanks;

-Dave P., BC_Handler

13. IC-208H and Programming Software

Yahoo group: ic208h
Date: 2008-09-02 12:39:06 UTC
From: Grant
Topic: 13 Message: 13

Hi all,

Grant from Western Sydney Australia here.

I have been using a Yaesu FT-8900 for the past two years, and generally I do like the 8900 but I don¡¦t use the 6m & 10m bands at all, well I have one side of the 8900 displaying the input voltage all the time □º Anyway I have been thinking about ¡V more decided to buy a IC-208H to replace the 8900 in the car.

One reason I am looking at the IC-208, is that it can be made to transmit (with a mod) out of band, so allowing me to remove two other radios from my car so I can use the IC-208 on a private frequency that I currently use and the CB Band.

Now to a question I was hoping someone may be able to answer, is that I have read on another forum, is if you program the 208 via the CS-208 software with frequencies out side the TX range, that the IC-208 will transmit without the physical mod being done.

So has anyone experienced this ?

If it does work, can¡¦t see the need to do the TX Extended Mod.

Cheers

Grant

Hi,
I have had the 208 for a couple of years now
and i would like to be able to program
it to scan between two frequencies.
I am missing something in the book because
it aint workin!
I have 80 channels programmed, no problem
but when it comes to this,i'm not getting it.
Thanks

24. RE: [ic208h] programming

Yahoo group: ic208h
Date: 2008-12-23 21:36:40 UTC
From: Robert Sheskin
Topic: 18 Message: 24
Attachments: 2 described; binary payloads are missing from this source WARC

I am guessing you do not have the manual? Here is the procedure from the manual:

_ Scan edges programming

Scan edges can be programmed in the same manner as

memory channels. Scan edges are programmed into scan

edges, 1A/1B to 5A/5B, in memory channels.

q Set the edge frequency of the desired frequency range in

VFO mode:

↪ Set the frequency using [DIAL].

↪ Set other data (e.g. repeater settings, etc.) if desired.

w Push [S.MW•MW].

• “!” indicator and channel number blink.

e Rotate [DIAL] to select one of scan edge channel, 1A, 2A,

3A, 4A or 5A.

r Push [S.MW•MW] for 1 sec. to program.

• 3 beeps sound and VFO is automatically selected.

• Scan edge 1B, 2B, 3B, 4B or 5B is automatically selected when

continuing to push [S.MW•MW] after programming.

t To program a frequency for the other pair of scan edges,

1B, 2B, 3B, 4B or 5B, repeat steps q to r.

• If the same frequency is programmed into a pair of scan edges,

programmed scan will not function.

Is this the issue or did I miss something?

Hi Lewis,

I bought my 208H from another ham; he did not include the mic with the rig, so I am unfamiliar with programming the rig via the mic. However, I had several problems, early on, with understanding how the rig worked. So, I did a little Internet searching and came up with a fellow ham who offered a "mini guide" for the 208H. Although it does not cover your question, if I were you, I'd shoot an email his way and see if he can help you. Here is the link to his website:

http://w5jck.com/downloads/Icon_IC-208H_mini_guide.pdf

Did you know that ICOM itself has a message board? You can find it on the ICOM America website. In fact, how I found out about W5JCK was to Google "ICOM 208H programming". If that yields nothing try, "208H programming", or variations of "mic programming", etc. There are ICOM reflectors too, like message boards. Just Google to find them!

You can also try www.radioreference.com

They have a section in their "forums" for ICOM rigs. The site used to be just for scanner geeks; now it's for hams too!

Let me know how you make out, won't you?

Alain

Topic: 18 Message: 27

Hi Robert,
Yes i do have the book but
i guess the old mind is playing
tricks on me hi.
I tried to follow the book but the
radio still searches somewhere between
144 and 165(instead of 144-148) megahertz.
Thank you for answering.

28. Program for repeater operation

Yahoo group: ic208h
Date: 2009-01-23 03:11:16 UTC
From: texasfoster00
Topic: 28 Message: 28

I need to program my 208H for repeater operation. Specifically, one repeater on 70CM and one on 2 meters. I tried following the manual and also a procedure sent to me by a fellow ham. No success with either one. Have not looked at the programming software yet, I'm doing this all manually with the dials or the HM-133.

Basically, I can't get the dup and the pl tone to work. Don't know why.

The above link belongs to Jack Swinden, W5JCK. If you click on the above link, you'll scroll down to the section that is called:
HAM Radio Mini User Guides by W5JCK
In there, you will find Mini guides for Kenwoods, Yaesu's and the ICOM 208H

If you find his mini guides helpful, pick up the phone and give you fellow Texan a call and let him know!

33. IC-208D Extended TX Mod Required

Yahoo group: ic208h
Date: 2009-02-20 05:28:55 UTC
From: Brett
Topic: 33 Message: 33

HI

Can anybody tell me if there is a mod to the 208D (same as 208H but japanese version) that will allow the radio to extend the VHF TX from 146 to 148 MHz currently it only TX to 146MHz ...

Thanks
Brett
ZL1OZ

If it cant be done then I have a really cool scanner (Cause thats all it would be good for) to throw in a cupboard and forget about :)

37. CS-208 vs CAT-IV

Yahoo group: ic208h
Date: 2009-04-11 00:27:49 UTC
From: Mike Binder
Topic: 37 Message: 37

Is the CS-208 the same signal as the CAT-IV ?

I have an IC7000 and use the CAT.
Can I adapt the cable and use it on teh IC-208h?
Can I use Ham Radio Deluxe or similar on it?
What do I need to set the memories?

I also have an TH-F6a and cable.
Is that like the CS-208.

I don't want to have to get another cable.

Hi Bill,

There is a great site for questions just like yours. Do a Google search for W5JCK.

On his website he has an easily understood, 6 page instruction sheet that will make programming, scanning and all the rest a lot easier. I found it by searching, because the owners manual just wasn't making it understandable for me.

Let me know if you need more help!

In the 2002, the grommet is under the front of the carpet on the
passenger side, I doubt they have changed that. Be VERY gentle
pulling it through, I've got my remote head mouted to the CD
storage compartment flap (in the open position) and the radio in the trunk. A shielded networking cable works fine for the mic extension.
A little speaker in the back seat, and it's all good.
No complaints from the service dept. at Honda.
Make sure to put fuses at the battery terminals.

I want to stop tx "errors" when I am receiving.
The BCLO feature on some radios prevents tx when there is a signal received.
Although you may key the mic it wont tx.
I can't find any reference to it in the manual and a web search
finds no reference to it either.

Regards,
Mark.

Have you checked for a setting like that in the programming software?
I'm sure I saw something like that in the software for at least one of
the Icoms I play around with, but I can't remember what model it was for.

50. squelch problem

Yahoo group: ic208h
Date: 2009-06-15 23:23:38 UTC
From: vk4zdb
Topic: 50 Message: 50

I sent this to ICOM Australia and didnt get a meaningfull answer. Has anybody else had this problem

I have an intermittent problem with my IC-208H, which occurs infrequently.

Icom Ic-208H running in memory bank scan, mixed VHF and UHF bank, any bank A to J.

Rig stops on a memory channel randomly, with no particular preference for any channel , VHF or UHF, with no signal strength displayed and unmute noise from the speaker. The squelch control has no affect. Volume works normally. Removing the antenna, terminating the rig in a dummy load , no affect. If the rig is switched of or has the power removed while in the unmuted state it remembers and starts up again in the unmute state when power is restored. If there is any activity on the channel the rig receives normally but returns to unmute noise at the end of the transmission. Taking the rig out of scan and then putting it back into scan cures the problem until next time.

My question is

Is this a known fault. Do I have a hardware problem or do you have a software bug.

Any suggestions?

Hello, Bob,
I would suggest turning the attenuator on, it's ATT ON in the setup
menu. It is only a 10db attenuator, but might be enough to kill off any intermod, as we call it around here.
Also, be sure you have the snap-on choke on the power cord right next to the radio.
PLEASE don't remove power from the radio while it is functioning, it's bad karma :)

Hope this fixes your problem.

From: opalockamishabob
Topic: 52 Message: 52

Hi All,

Before I go and install my rig, I'm taking some time to find the best spot to mount my Diamond SG-7500 antenna. The vehicle is a 2003 Toyota Tacoma, with a steel bed.

I've been told that "getting the antenna "in the clear" is the best way to mount these things". Nothing is more clear than a truck bed.

As strange as it may sound, I've had an idea about mounting it on an aluminum bar that spans the bed, from left to right. What I'm proposing is not mounting the antenna IN THE BED, but ABOVE IT.

I've got experience in metal working, but little experience in antenna locating/mounting!

All suggestions will be most gratefully received!

73 and many thanks for taking the time to respond!

Alan

> > Alan
>

Alan, The best antenna mounting position for a 144/440 antenna would
be the center of the exterior cab roof. This would provide the best
ground plane".

If you mount a normal 1/4 or 5/8 wave antenna on an aluminum bar
across the truck bed, the antenna will tend to be bi-directional in
the direction of the bar. It will tend to have the least signal
strength toward the front of the truck, and toward the rear
of the truck. The greatest signal strength will be off to both sides of the
truck. This is not something that is optimal for a mobile
installation. It will work fine when you are close to the repeater,
but, signal strength variations will become noticeable when you are in a fringe area.

I also suspect that an antenna mounted to an aluminum bar might be
subjected to more vibration and "whipping" than an antenna mounted to
the center of the cab. I would suggest that you avoid any antenna
that has center or top mounted loading coils. I would use a 1/2 wave
antenna for installation on the aluminum bar. The 1/2 wave antenna
tends to be more tolerant of its "ground" connection, and most likely
will give a better radiation pattern.

I myself would use something such as the Diamond NR770HA or Diamond
NR770HNMO. It has a coil at the base, and the whip is one piece of
stainless steel. One piece means no screws (except for the base
screws) to come loose from vibration. You can find this antenna in
silver or black for about $50 from your local dealer. Mounting base is
extra. Other sources than Universal may be less expensive, but, here
is a link to the antenna description.

I just put my IC-208H in my new Ford Explorer Sport Trac. I, too, had a similar concern about mounting an antenna. A buddy of mine purchased the Workman WEP-200 on-glass antenna and had nothing but nice things to say about it. Better yet, it was only $25.00 with shipping. I figured I'd give it a try - for $25.00, if it wasn't all it claimed to be, I wasn't out a lot of money.

Well, let's just say it was everything I thought it would be and more. I also use my 208H to monitor extended frequencies (up to and including 800 Mhz). I have absolutely no complaints on the receive side. On 2m and 440, transmit SWR is less than 1.2 - 1 at full power.

I have uploaded a couple of photos and they're here:
http://groups.yahoo.com/group/ic208h/photos/album/981601800/pic/list
<http://groups.yahoo.com/group/ic208h/photos/album/981601800/pic/list>

Take a look at the Workman website here:
http://www.workmanelectronics.com/main.htm
<http://www.workmanelectronics.com/main.htm>

and K1CRA's store has them for $22.00 here:
http://www.k1cra.com/catalog/product.aspx?productID=1698
<http://www.k1cra.com/catalog/product.aspx?productID=1698>

I don't think you'll be disappointed.

That was a very helpful post that you sent me! Thanks so much for taking the time to tell me about your experience. I will post photos of my install just as soon as I conclude what it the best way to proceed.

Thanks again!

Alan

Hi.
I'm new to the group.
I'm woundering if any one has or knows of a link to get details for making a programing cable for this radio?
I have the software but need the cable details.
Many thanks and 73's
Dave

Dave,

Just do a Google search "ICOM 208H programming cable" and you'll get plenty of leads! Some guys have made them from computer parts. You can also buy one for about $10.00 off of EBAY. The cable works great.

Alain

Hi All,

Does anyone know if it is possible to monitor the input frequency of a repeater with the 208H?

I've got this feature on my Kenwood TM-261A and it really comes in handy at times. Just press the button and you're there!

Alan

Hi Ray,

You Aussie chaps are the best! I bought my rig used and it did not come with the stock HM-133. The previous owner bought a Heil HM-ic. The small stick mic? Yes, I get great audio reports with it, so I'm happy. BTW, the MONI button on the removable faceplate performs the function as well.

Again, many many thanks Mike!!

You can do local area PSK on FM mode no problem. I have done this before, Modulation FM AM USB LSB doesnt matter as long as both people are using the same thing.

Software is available on the net just search CS-208 cloning software or its available from an
Icom dealer. Need Windows 98/200/ME/XP.

The cables you require are one of the following

OPC-478U (usb type)
OPC-478 (rs- serial type)

Hope it helps

Search on ebay, there is a vendor call kawamall that you can get the cable from and works great! Cheaper than icom as well.

Chad,

I bought the cable off of EBAY. I had purchsed a similar cable from this vendor and it works just as well, for the past 2 years. The software came with my 208H, so all I needed was the cable.

Let us know how you make out, won't you?

One more site for the OPC-478 home-brew cable.

I've just found his one; it has the software download listed also.

Hope this helps, Chad!

Alan

Chad,

Above is the link that I found when I was going to begin making my own OPC-478 cable. I didn't have any of the parts, so I just bought the cable on EBAY.

Thanks for the information group!

BTW. Does anyone know the exact pin-out for making your own serial cable? I have the stuff, not having much luck finding the pin-out on the internet.

Thanks,
Chad

Oh, and any PNP and NPN transistors work. 2N3904's and 2N3906's are common
as dirt. 2N2222's work fine. Personally, I really prefer the MAX232 level
converter approach (I use those for ANYTHING that needs a serial interface).

Great Info Guys!

I will see what I come up with this afternoon, either build or buy one depending on parts I have.

I love the 208H, very nice rig for the money, getting ready to purchase a third unit.

There are two options; the Icom software and just about any CI-V cable that has a stereo 1/8" plug, or the RT Systems software and cable.

The Icom software can be downloaded from the file section of this Yahoo! group, and you can get a USB cable from seller Kawamall on eBay for about $11 shipped. Unless you have a lot of repeater info and want to cut and paste or import it from a database, this is not your solution. If you wanted to make entering the data by hand a lot quicker and easier, this is a very cheap and effective solution.

The RT Systems software lets you cut and paste, which is very handy if you have a lot of data to input into the radio. The software is $25, and their own cable is $30 (and you'll need a cable or USB adapter that has an FTDI chipset, and that might still not work, if you don't use the "special" RT Systems cable).

I bought the RT Systems software before I found out that it needed their $30 cable as well, and I had a lot of difficulty getting the software to run on several computers. Granted this is a holiday weekend, but tech support emails have gone unanswered thus far for a week. By contrast, I installed the Icom software first try, and it worked fine with the Kawamall cable (It uses a Prolific 2303 USB to serial chipset, a very good chipset for such a task).

Incidentally, Icom calls it cloning mode whether you are programming from or saving to a computer, or are doing direct radio-to-radio transfers. To the radio, it's the same difference.

I purchased the programming software and the USB for the IC-208 at RT Systems in Hermosa, SD.
They have website that you can order from.
www.rtsystemsinc.com
They have a very good tech support.
Very helpful to me.
Good luck
PS: Also a nice feature is being able to program into the IC-208
repeaters from the ARRL program
"TravelPlus 2009-2010 edition.
Works good. Just takes a little getting use to.

I picked up a third party USB programming cable for less than $12 from ebay
(
http://cgi.ebay.com/USB-Programming-Cable-to-ICOM-IC-V8-F22-IC-208H-OPC-478_W0QQitemZ120499914688QQcmdZViewItemQQptZLH_DefaultDomain_0?hash=item1c0e5ac7c0).
Appears to be good quality and works great. The company offering the product
is Kawa Mall, who offers programming cables for other radios as well.
Hope this helps
steve

From: rijake15
Topic: 95 Message: 95

Hi all, I recently purchased a 208h and also got the usb cable from Kawa-mall. I downloaded the cs208 software and have all my info entered. Problem is when I go to upload to the radio it asks for the COM port to be entered. The program is not recognizing the cable as a USB. The cable driver is properly installed I just don't know what COM port setting to use for a USB. Any ideas?

Will the cs208 software work with a USB cable?

Thanks

116. Squelch/Attenuation issues

Yahoo group: ic208h
Date: 2010-02-16 18:59:57 UTC
From: trlby_az
Topic: 116 Message: 116

With my squelch/ATT switched on and while on UHF with my rig tuned to a weak signal (1-3 bars or so) I am having problems with how the squelch works. I understand that with my SQL rotated completely clockwise the ATT circuit kicks in and the signal will drop down. It will reduce the S-unit on the display and white noise, associated with a weak signal, will be heard. When I reduce my ATT/SQL rotating the SQL counter-clockwise the S-meter will start to increase in signal strength indication and the signal will start to sound stronger (ie: less white noise). That all seems normal and to be expected. Then when I continue to loosen up my squelch the S-meter increases yet the signal gets weaker in audio going almost completely into the white noise.

I have the same problem with the ATT feature turned off.

Anyone else have a similar problem? It only occurs on UHF and only with signals that are not full scale. I'm trying to determine if there is a problem with my radio or something else I might need to do before sending it in to Icom. I have done all reset functions and this still occurs.

Thanks, in advance, for any help on this.

Hi Ken,

My 208H does the same thing, it seems to receive best at the
point where the ATT display comes on.

Sometimes mine seems to go deaf with the squelch closed, which
makes me think the squelch adjustment might be worn or dirty.
Mine has got to be close to 10 years old.

Is Yours a new radio??

I would have to go with Keon.

My old FT-8900 could cross band, but seen nothing in the O/M or other material that says the 208H supports cross band.

123. direct memory channel accessability

Yahoo group: ic208h
Date: 2010-03-16 20:37:03 UTC
From: Michael Johnson
Topic: 123 Message: 123

Is there a direct access of a channel ability?

For example, if I am on memory channel 3, and want to change to memory channel 253 for example, is there a way of a direct entry to get there? (like my IC-V8)

Thank you

mike johnson, kc9qlt

Hi Michael,
If I understand what You want to do correctly, just press
the enter button (C) followed by the memory number, in
memory mode of course. Same as direct entry in VFO
mode.

If you are in memory mode, press enter key in the microphone, dial 253 (or your desire ch) then press enter.

Thank you both.... That worked.

I figured that there had do be a simple way to do that, but the manual is so difficult to understand, I certainly couldn't find it. I am still a newbie, having only been licensed for about 6 months.

I have only had my 208h for a couple months and am quite happy with the radio so far. It is installed in my 2005 Prius with a Larsen NMO 2/70 on a bracket that I had a local metal shop fabricate for me. I get some occasional RFI from the car's water pump(?) kicking on, but it only lasts a few seconds - I can live with it. My IC-V8 is not as forgiving as for RFI from the Prius.

Thus far, neither radio had caused the car to speed up, nor the brakes to fail.

Thank you again

127. Audio Problem

Yahoo group: ic208h
Date: 2010-03-18 14:30:28 UTC
From: Erik F
Topic: 127 Message: 127

I have an IC-208H installed in my truck. It's behind the seats and the remote head is on my dash. I have an external speaker under my dash and I ran an extension for the mic. I've had the setup in my truck at least 8 months and it's been working great. I'd been very happy with the radio... until yesterday.

I was driving down the freeway talking to a couple other guys and when I finished my xmit I didn't get a reply. I looked at the head unit and the bars where all the way up (recieving). So I messed with the volume and squelch a bit but no sound. Grabbed my HT and turned it on (wondering if there was a repeater issue) and I could hear the conversation just fine. So I grabbed the mic for the 208h and xmit worked fine. I was thinking I had a bad cable... so I got home and started pulling cables.

I ended up with the radio on my bench and still no audio. Not even the button tones. I even did a complete reset with no luck. I searched here and google... I thought I read something about this but now I can't find it.

Any ideas?
Thanks & 73.
Erik / KE5VBO

My first guess would be a bad volume pot. You can adjust the volume from the mic, so see if you can get some audio that way. If the numbers scroll up, but it's still quiet, then your problem is deeper in the radio.

Michael

I found it in the manual.
I meant to say BANK scan.

It's a form of memory scan, but you can select which group of memories to scan without disabling each unwanted memory channel individually. I can program 500 memories, but may only want to scan the local repeaters, so I'd put them all in one bank and scan that. Or I can scan all memories or a different bank.

139. Scratchy Audio Control

Yahoo group: ic208h
Date: 2010-04-16 12:56:11 UTC
From: Steven
Topic: 139 Message: 139

Hi All,
Looks like my audio pot is going. The volume will go down a few notches suddenly. If I play with the knob I can get the volume back up after playing with it for a while. Very inconvenient.

Has anyone replaced their audio pot in the control head? How difficult is it? Where did you get the part? I was thinking of taking the control head apart first and trying to find the part at Digikey/Mouser. Wondering if it is easier to just call Icom?

73,
Steve, W2MY

141. S Meter reads low on very strong signals

Yahoo group: ic208h
Date: 2010-04-18 23:38:07 UTC
From: johnniemajor
Topic: 141 Message: 141

Any one ever notice if their IC-208H S meter reads around half scale when receiving a transmission from a close transmitter (h/held included) on UHF.

Mine appears fine on weaker signals and and looks reasonably accurate it's just the close stations that don't make full scale and yes the attenuator is off. it's brand new so I know it has not been fiddled with maybe the AGC working overtime.

John

142. Re: S Meter reads low on very strong signals

Hi John,

Sorry to hear You're having a problem with Your 208H,
Mine is presently running as a digital voice node on UHF,
and when receiving, shows full scale.

I suppose You could try a full reset, or toying with that
s-meter setting in the service menu.

143. Output on UHF CB

Yahoo group: ic208h
Date: 2010-04-19 11:04:53 UTC
From: Special Chicken
Topic: 141 Message: 143

Hi all,

Has anyone done any testing on UHFCB (477mhz) on their 208H?? I measured mine the other day and it was 14w on full power at 477.400mhz, I was surprised it was so low. Do you think a higher SWR would contribute to this?? The lower the SWR the higher the output or is it fixed no matter what SWR reading?? I was getting a reading of 2 SWR on a dual band antenna but I was going to tune the antenna to mainly 477mhz as it is a good RX antenna for airband.

.

Cheers

Jas

It's not weird at all.

Generally speaking, transmitters are designed (and filtered) for a specific band. The filtering keeps interference out of the adjacent bands. When you operate out of the specified bands of the transmitter, the only thing that's getting through is what's leaking through the output filtration. Add a bad match to the antenna and what you've got isn't surprising at all.

No idea.

Does it really matter since 15w is 3x the legal limit anyway?

Yeah I wanted higher output for when I am out hunting in remote areas 5w is not enough..15w allows me to get back to homebase but a little bit more would have been nice.

I know it is higher than legal but when lives are on the line it don't matter. I only use 5w when back in the city.

Okay, I needed a laugh today.

The IC208 is:

1) not type accepted for those frequencies
2) illegal to use on those frequencies (see #1 above)

You stated in an earlier post that this effort was "strictly for testing purposes". Doesn't sound like there'll be much testing while you're out hunting.

Are you even an amateur radio operator? A responsible ham wouldn't even think about using non type-accepted equipment on frequencies where that equipment isn't allowed. I value my license too much to screw around with such things.

thats funny cause it works on mine.

yes it originally was only for testing but now i have a new use. yes i am a Ham and you should really mind your own business.

In future when you need a laugh you should just find the closest mirror and look into it...bound to work.

Well, posting it here in a public forum makes it everyone's business. Furthermore, as the previous poster stated, it's not type accepted for *any* operation at *any* power level in the bands you are using it. Don't feel you need to justify your operation to us, we don't matter. It's the FCC that you'll have to answer to. Sure the "life and death" bit is a plausible use, but you'll need an airtight case to avoid prosecution.

Don't get angry with us because we are pointing out the facts.

156. Bank scan

Yahoo group: ic208h
Date: 2010-04-27 21:11:52 UTC
From: N6OHS
Topic: 129 Message: 156

I finally got around to using this...

To scan a subset of memory channels, scan by BANK instead of MEMORY.

Program a channel into a bank by:
- Press M/Prio to select memory mode.
- Rotate DIAL to select a memory channel.
- Press SET to enter set mode.
- Press SET until BAK shows.
- Rotate DIAL to select bank, say "A"
- Press V/Scan to exit.
Do this for several channels.

To select a bank:
- Press M/Prio to select memory mode.
- Push BAND to enter bank mode.
- Rotate DIAL to select bank.
- Press BAND to select that bank.
Now only that bank's channels are available.
Rotate DIAL to see / select memory channels in that bank.

To SCAN that bank's channels only, select the bank then press and hold V/Scan to start scanning just that bank.

If you have several BANKS to scan, link them.
To link (from manual - I have not tried this part):
- Press SET to select BKL (bank link) setting.
- Rotate DIAL to set BKL to ON.
- Push SET to select desired bank to link. (e.g. BLA = link bank A)
- Rotate DIAL to select "ON" to link the bank.
- Repeat steps to link other banks.

Now (according to manual) all memories in linked banks are scanned.

I have to check:
- Does SKIP programmed for a memory channel skip in bank as well as memory scan.

> > I meant to say BANK scan.
> >
> > It's a form of memory scan, but you can select which group of memories to scan without disabling each unwanted memory channel individually. I can program 500 memories, but may only want to scan the local repeaters, so I'd put them all in one bank and scan that. Or I can scan all memories or a different bank.

Just an informed guess, but...

The CPUs used on the main amd control head boards are MASK ROM with a bit of ram (1k).

There is a 128k EEPROM on the main board.
I'd say that's were it is located.

158. Re: Memory Channel Numbers

Yahoo group: ic208h
Date: 2010-04-27 21:56:02 UTC
From: N6OHS
Topic: 38 Message: 158

I had that problem once and it took a while to find why I had no memory channels listed.

You are probably in BANK memory mode.

If you were in memory mode and hit BAND, you go to BANK mode.
I think you have to hit BAND twice to exit.

Mike - N6OHS

161. Programming the icIC-208 using CS-208

Yahoo group: ic208h
Date: 2010-05-02 11:14:21 UTC
From: robbip_pete
Topic: 161 Message: 161

G'Day all,
This is my first post and my second day in this group.
I get my IC-208H tommorrow.
I got the CS-208 so I could start setting things up, and use the radio when it gets here.
I chose the rig because it uses the OPC-478 like 3 of my other rigs and therefore I didnt need to buy an extra cable.
My question is, can I use the CS-208 to make up memories in the different banks before I download what ever is in the rig or must I download and edit the *icf file first?.
The reason for this question is that the IC-2800 must be downloaded first and I dont want to waste time setting up an icf file if there it will be of no use.
The rig is brand new
Peter R

You can set up everything ahead of time in the software and when the radio arrives, plug it in, dump the programming in and you'll be good to go. Just a suggestion though: when your radio arrives, read the contents and save the programming in case something goes wrong. You'll have the defaults to reprogram.

172. Antenna Selection

Yahoo group: ic208h
Date: 2010-05-28 15:34:11 UTC
From: trescue9
Topic: 172 Message: 172

Hi guys, I just recently purchased my ic208 but haven't installed it yet. My hang up is on an antenna selection. I have a 2005 Ford F150 Crew Cab. Ideally, I'd like a permanent mount antenna and not a mag mount. Obviously as low profile as possible. I was kinda curious what you guys were using and what you would suggest. I'm not against drilling a hole, but I'm considering lip mounts too, maybe on the back door? Anyway, your thoughts would be greatly appreciated.

I use the Comet B-10 NMO

The Comet B-10 dual band is a 2 meter and 440 MHz mobile antenna. It provides gain of 2.15 dBi/2.15dBi. VSWR 1.5 : 1 or less. This antenna can handle up to 50 watts. It has a black, cellular appearance. This antenna is pretuned, but an Allen wrench for adjusting is included.

NMO is the drill the hole in the car, nmo magnet is a magnet mount with an nmo connector, etc.

179. Cs-208

Yahoo group: ic208h
Date: 2010-05-31 11:58:38 UTC
From: robbip_pete
Topic: 179 Message: 179

G'Day All,
I have had a note from a mate who believes there is a nearer version of the CS-208 than I have which is Rev 1.00.
I would like to upgrade and will buy the software if the OPC 478 works with the newer ver of the software.
Has anyone in this group got the newer ver and if so do you need to buy a different interface cable.
Does anyone know of aftermarket software that uses the OPC-478,Iknow someone in the UK writes excellent software for Yaesu but that seems to be his limit
Thanks
Peter R

Topic: 141 Message: 181

Hi Jas,

I have owned a IC-208h for over 3 years now.. and moded for CB Band. the unit does: low-5, med 15, High 50, watts all depends who has done the mod. also you HAVE TO use a Proper matching antenna and a swr meter to see what is actually happening. do not use more the 4-5 meter of rg58 cable. the antenna that i used was a diamond dual band as they seem to have a better range on tx as well.. at 50watts my swr was at 2.1 and at 5 watts the needle from SWR was hardly moving. YES i am an amateur radio operator for people that wondering.. and for those that family comes first i know what it means to have the power there when needed. i use 5 watts on UHF CB in the city 10 km out of the city i use 15watts. i never used 50 watts on the UHF CB but is good to have it as a backup if you stuck in the middle of the outback. Legally you can call out on any frequency as long as it is a distress call ONLY! lives come first.

anyways... do not abuse the power of RF. if you want long range calling then make sure your antenna matches the radio otherwise will get RF Reflected back into the radio and power automatically drops to save your radio from burning out. (REASON WHY YOU GET 14WATTS AT MAX POWER) it goes in protection mode.

Sorry for the late response....was on vacation.

If you haven't bought one yet, I highly recommend the following antenna:

http://cgi.ebay.com/Dual-Band-Glass-Mount-Antenna-2-meter-70cm-WEP-2000-/400092776848?cmd=ViewItem&pt=LH_DefaultDomain_0&hash=item5d27634990

If the link doesn't work, go to eBay and search for "Dual Band Glass Mount Antenna/ 2 meter & 70cm WEP-2000".

I run this antenna on the rear window on my 2007 Ford Explorer Sport-Trac. It has great ears and I have no trouble on the TX side as well. Although I checked the VSWR with my Bird, it required NO tuning out of the box.

Best of all, the guy will give a 7 day money back guarantee if you don't like it and it's free shipping.

Good luck.

186. No TX using PTT

Yahoo group: ic208h
Date: 2010-07-23 06:09:20 UTC
From: W2IRT
Topic: 186 Message: 186

Hi folks,
This afternoon something changed in my 208H and I lost the ability to put the radio into transmit using the PTT on the mic. I have tried using the mic connected to the body of the radio directly and through the extension cable and no change. It has been working perfectly for years and all I can think of is that I accidentally pressed something I shouldn't have on the mic or front panel.

All other mic functions work normally and I can send DTMF tones with the mic (the radio goes into TX properly to send the tones). When the squelch is open and I press the PTT button there is no attempt to switch the radio out of RX mode.

I'm 300 miles from home and have all my currently-programmed local repeaters plugged in as well as everything for my trip back home, and I don't have my programming cable handy thus doing a full reset isn't an option at this time. Is anybody aware of a setting that would disable PTT from the mic, even after power has been pulled to the radio and restored and a partial-reset done? I can't find any reference in the manual.

Thanks in advance.
Peter, W2IRT

Topic: 186 Message: 187

Peter,

There has been an overwhelming problem with the Icom microphones on their newer model dual band rigs respectfully the V8000 208H 2120 radios. The problem is sometimes you press the PTT and you hear the click but get no transmit. The HM-133 mic doesn't use a conventional PTT circuit, but a microprocessor as well. The standard mic uses a plain old contact closed-TX, contact open-RX circuit.

You take the back cover off by removing the two bottom screws. Then separate the two sides by lifting the end first where the screws are and the other end has a small tab you pull away after you lift. Take the long plastic thumb button out. Take off the grey rubber cover on the PTT mechanism; it looks like a little round top hat. When you remove this you will expose the red button that is the extension of the contact. Take a Q-tip full of alcohol and stick it in and work the red button while the alcohol drips through. Work the contacts a few times and give it a try. Make sure alcohol doesn't drip or stray other places within the mic. Let it fully dry and test.

73,
Dave

From: AlainMichel
Topic: 186 Message: 188

Peter,

Dave's advise is spot on! My 208H came with the small Heil "Handi-Mic" and coiled extension cord. The transmit became a non-op one day. I spoke to Bob Heil and was told to use an electronic cleaner spray on the mic button. Worked the contact while using short bursts of the spray on the contact.

Let it dry for a moment and quicker than you can say "Bob's your uncle..." the mic was back to working perfectly.

Failing that, you might try a "PARTIAL RESET": with the rig "OFF", press the "V/MHz/SCAN" AND "SET/LOCK" buttons, then push the "POWER" button for 1 second.

Let us know how you make out.

73,

Alain

Thanks for the heads-up guys. I was in Montréal for a few days when this manifested itself and I had neither tools nor the programming cable/software to re-install the whole radio in the event of a full reset. I'd already done the partial reset with no change in the problem.

I basically banged the heck out of the mic and it started making intermittent contact again, so I'm going to assume the little microswicth is indeed at fault. Now that I'm back home, when I get some time, I'll mess with this a little and see what happens. I've also got a second 208H in my truck and tomorrow I'll swap out mics, which should confirm the situation right off the bat. I'll let the group know as soon as there's a resolution.

I can confirm that this is indeed what failed now. A little alcohol made it marginally better but i think the switch is still a little borked. On a couple of attempts it latched closed and once or twice it was flapping open/closed rapidly. I used some compressed air to blow out any schmutz and am letting it sit for a few days. If it's still bad, I'll see about trying to find a new switch, or send it off for repair.

Thanks one and all.

191. Any reviews of the RT systems software?

Yahoo group: ic208h
Date: 2010-07-28 03:24:44 UTC
From: W2IRT
Topic: 191 Message: 191

I have the original ICOM version 1.0 of the programming software for the 208H. It's probably the most horrendous RSS I've ever used, but the bottom line is that it *does* get the job done to one degree or another.

I'd like to have 3 or 4 codeplugs available, depending on where I'm about to travel to and I was wondering if anybody's tried the RT Systems software/cable. Is it worth the $50 investment? I'm no fan of paying for the same tool twice, but if this is the only way I can copy/paste large blocks of memory locations it may be the only way I can get what I need done.

Thanks in advance.

I will second going with an NMO-mount. If you were installing this in a passenger car with a trunk I'd recommend a trunk lip mount that adjusts in 3 axes to get it perfectly vertical. Since this is going onto a pickup truck, then I'll recommend drilling into the roof and installing a permanent NMO mount.

Since you're drilling into a nice truck and doing it right the first time is important, I'm going to strongly recommend buying an Antennex 3/4" NMO hole saw. these fit into a drill and are intended to do the job of mobile installations correctly. Drill through the roof, not the head-liner.

http://cgi.ebay.com/Antenex-HS-34-NMO-3-4-Hole-Saw-NMO-Style-Antennas-/220516310857
This is one, but you may be able to find them cheaper elsewhere. I bought mine about 3 years ago and it did the job perfectly on my old Ford Ranger.

As a last ditch effort to rectify the problem, might I suggest that you try an electrical contact cleaner. There is a product called "DeOXIT" and "DeOXIT GOLD". You can usually find it at a Radio Shack or stereo and electronics store. Use the DeOXIT as directed on the contact. Then, use the DeOXIT [lubricant] on the contact.

Cost is around $10 for both; they come as small spray bottles in a "blister" pack.

Good Luck,

Alain

I bought Version 4 with cable for the IC208H, T90A and W32 this year at Dayton. (only needed the one cable)
I am running Windows 7 Ultimate N, 64bit and the RT Software works flawlessly. Well worth the money. It sure beats the manual procedures.

200. Power connectors

Yahoo group: ic208h
Date: 2010-08-18 02:35:35 UTC
From: ronrn18
Topic: 200 Message: 200

Is there a name for the type of power connector on the IC-208H radio or at least a location I could find additional female (and possibly male) connectors of this style?

201. CS-208 & tuning steps

Yahoo group: ic208h
Date: 2010-08-18 02:42:54 UTC
From: ronrn18
Topic: 201 Message: 201

I have just pulled out my IC-208H radio after nearly 6 years of non-use and have purchased the CS-208 software package and programming cable. I have yet to actually program my radio (awaiting upgrading my laptop from 64-bit Vista to 64-bit Win7 to allow for driver to install), but I'm entering in the frequencies I'm planning on using. One thing that is confusing me is programing the tuning steps in memory channels... I was under the impression that tuning steps correlated with VFO mode and searching, not a memory channel. Can someone clarify the use of tuning steps in programming memory channels?

Topic: 200 Message: 202

Hi Ron,

I was asking the same question a few months ago.....I have only heard of them being referred to as "T-connectors", but you may not have much luck at finding them.

After wrestling with plugging and unplugging these, I finally had the connector pull apart on my bench powercord. I searched all over, but Radio Shack doesn't stock them, and the salesperson on the phone at AES said that they did not either. I finally found someone on eBay selling them, but at the price that they were asking plus shipping, I took a pass - besides, would I have them pull apart again in a few months?.

In my search for these connectors, I found info on the Anderson Powerpole connectors and also I found this on wikipedia: "The Anderson Powerpole has been adopted by the amateur radio community as their standard 12-volt DC power connector for everything from radios to accessories."

OK, so I bought a whole bag of powerpoles for not much more than a few T-connectors would have cost me and reluctantly snipped off the troublesome T-connectors and replaced them with the Powerpoles. I bought mine at AES, but if you google powerpole, you'll find several places that stock them.

There are a couple helpful videos on Youtube that show step-by-step instructions on how to assemble them, and even one that tells you how you can crimp and assemble them without having to buy the $40 special crimping tool... (ok, I admit that I did screw one up)

I am happy that I did replace them.... They snap and unsnap much easier and quicker than the T-connectors do.

Hi,

I have the same problem since yesterday, i made some changes to the programming. When I opened the radio a few hours later I was surprised not to hear the usual beep. I have no audio and no key beep. I ve check the speaker connection inside, tried an external speaker ... Nothing.

I tough it could be a simple set-up problem but i don't find anything wrong. If anyone has an idea it would be extremely appreciated.

Hi, I've got the programming software for both the IC 208 and ID 800 and have the OPC-478 usb cable. What I can't find (and did have) is the OPC-478u driver.
Would anyone be willing to send me a copy of the driver (XP version) to get me out of trouble? The only driver I could find on the Icom website is for Vista.

Did you check the url I gave you for download. I discovered after I sent you the first email that only the cable arrives by post and one downloads the driver

Its not an icom cable but one made in hong kong by prolific.

So if yours is a icom original I don't know if this driver will work.

Hi Don,

I didn't get around to checking it out but would you believe that I finally found it. My three year old had taken it to another room and it was sitting in his toy box!!
It's now safely residing in my shack again. Hidden.

Thanks for the info anyway. The site looks very interesting and I will check it out further.

Topic: 215 Message: 215

Hello,

This is Mac, WI4NDS. I have joined to learn about this radio toward possible purchase down the road. I have not been to a candy store nor a hamfest to see it up close. My health is a bit of a problem. Anyway, I also notice there is no rear view of the radio anywhere on the Icom ads nor elsewhere. Is there a fan in the rear of this rig? How tolerant is this radio to running regularly on high power?
Thanks.

Hi Mac. Welcome to the group. Your right ICOM doesn't show a rear view of the IC-208H, Mainly i think because there isn't all that much to show.
What you have on the rear panel is a Data socket, antenna, head phone socket and power connector. There is a small fan mounted in the middle. Definitely a requirement on this radio as full power produces alot of heat, Well mine does.
The radio is a good dual bander, my first, normally not an Icom owner, but well pleased with this radio. One point i would make is the programing can be a pain. not something to attempt when driving. There are programs around to sorta help with this but the cable will cost an arm and leg.
If you buy this radio I'm sure you will be happy with it, had mine now for 4 years with no problems.

Hiya to both replies on here . I have only owned my 208h a few months.

I am more than happy with it, yes programming is a bit of a pain until one has the system stored fully in the brain

But then most modern radios can be like this.

500 memories in a number of groups, 50 watts power.

I also own an ic 7000 hf rig

I was impressed with setting up repeaters, as it just knew the split and tone, if needed ,with out any entry from me.

The software to program the unit is listed on the group under files. Its NOT a great piece of programming but it does save memories . its not printable or cant be transfered to a spread sheet or to another type of radio

And the usb cable is available off ebay via hong kong for as little is us $1.99 plus an arm and a leg for postage

Converted to NZ dollars about $17.00 landed here in zl ,and icom wants $79.00, The package took 3 weeks to arrive and came with a mini disk for drivers.

Hi Mac. Welcome to the group. Your right ICOM doesn't show a rear view of the IC-208H, Mainly i think because there isn't all that much to show.
What you have on the rear panel is a Data socket, antenna, head phone socket and power connector. There is a small fan mounted in the middle. Definitely a requirement on this radio as full power produces alot of heat, Well mine does.
The radio is a good dual bander, my first, normally not an Icom owner, but well pleased with this radio. One point i would make is the programing can be a pain. not something to attempt when driving. There are programs around to sorta help with this but the cable will cost an arm and leg.
If you buy this radio I'm sure you will be happy with it, had mine now for 4 years with no problems.

I just bought a used IC-208H and it came in the mail yesterday. Pretty cool.

Are there any programs that allow the rig to be connected up directly to the computer? Then are there any schematics for doing such an interface from the 6 pin DIN to a serial port or parallel port?

Thanks,

Jerry N9XR

I connect the packet connector directly to the sound card line input and the line output jacks. I made a 1 transistor circuit to key the PTT from a Serial Port line. I use Flidigi for digital modes and another program(don't remember right now - I am not on the ham radio computer) for packet. Except for not having anyone to talk to, the packet works FB. Any of the several sound card data programs will work.

Great. I will try to gin something up and make it work.

Thank you very much.

234. Itermittent Hand Mic PTT

Yahoo group: ic208h
Date: 2011-01-11 02:55:44 UTC
From: chad_n0yk
Topic: 234 Message: 234

Hey Group,

Has anyone on the group replaced the PTT switch on a HM-133 hand mic for the 208H? Mine is intermittent at times and should be easy enough to fix if the switch is available through Icom.

Thanks,
Chad
N0YK

From: Jerry Surritte
Topic: 235 Message: 235

I have found this to be a common problem with this mike. I took mine apart and carefully used spray component cleaner to clean out the PTT switch, blew everything out carefully with canned air. Let it dry good and now no problems after a month of use. I have heard some that have had to resolder the PTT switch pins to the board.

Hi Chad,

What specifically is wrong with your hand-mic? Is it a failing PTT button by any chance? If so, there's a simple fix for it that I discovered on this reflector last summer after mine failed a few hundred miles from home. Check out this thread:

http://groups.yahoo.com/group/ic208h/message/187

Topic: 234 Message: 237

Hey Peter,

Yes I did discover that message on the reflector. I thought mine was more of a mechanical problem with a switch (not making good contact). Someone might elaborate if there is more to this switch than a mechanical connection and maybe a capacitive connection.

I will try and clean the mic switch before I try to replace it and report back how it goes.

Thanks for you reply!

73,
Chad

238. Separation cable quick disconnect mod

Yahoo group: ic208h
Date: 2011-01-11 21:21:39 UTC
From: trlby_az
Topic: 238 Message: 238

Has anyone modified their separation cable to incorporate a quick disconnect jack & plug near the control head? It appears the cable is 4-conductor.

Since the separation cable screws on to the back of the control head, detaching it when I want to stow the head is anything but quick and convenient. I'd like to go with some sort of jack and plug that are small and low profile (in-line), rugged enough to handle repeated plugging/unplugging, and easy enough to install without having to do micro surgery.

Thanks!

239. Data Cable

Jerry,

You can buy a cable off eBay for like $7, so not really worth the hassle of making your own. I have this same cable and it works great!

Serial: http://cgi.ebay.com/OPC-478-Programming-Cable-ICOM-IC-208H-IC-F22-IC-V8-/330523096217?pt=LH_DefaultDomain_0&hash=item4cf4b63499

Good Luck,

Do a search for OPC-478 and you will find plenty of hits for a schematic.

Thanks for the input Chad. Ebay says that the $7 ones are out of China and there is the Chinese New Year coming up. So the holiday will push out the shipment until the 14th. Then there is the wait after that of shipping. They expect the ones ordered today will arrive the 26th or so. Then they have a place from the US to ship from and those are $17. But I guess I should quit whining and order something, right? :)

Thanks for all of the help. I will get something going.

I couldn't get the hong kong one to work in either vista or XP. Gets
an error message "# 10" in vista and reads erratically and doesn't
write at all in XP.

The prolific website says error #10 is dues to chines imatation USB
serial chips and actually says "good luck with that".

Time to make and RS232 one using the original circuit (minus the error
that's in it).

From: AlainMichel
Topic: 294 Message: 294

Hi All,

I looked in the owners manual and did not find a listing for this.

Our C.E.R.T. group has a 147.585 MHz output and a 144.930 MHz input repeater.

My Kenwood h/t has provisions for this type of operation, but I can't find it in the manual.

So, I'm turning to you wise folks.

Has anyone done this with their 208H?

If so, would you help me, step-by-step, please?

Many thanks!

Alain

From: dave
Topic: 294 Message: 295

Alain:
It is on page 24 of the manual under "Offset frequency" You would need an
offset of -2.655 MHz)
IF you are in VFO mode, enter 147.585 for the receive freq.
Push {Set-Lock} key to enter set mode
Push {Set-Lock} or{S.M W-MW} until DUP and offset frequency appear
Rotate {Dial} to set the desired offset frequency(-2.655).
Push {V/MHz-SCAN} to exit sent mode.

If in VFO mode, then save in a memory channel.

My ic208 is inop right now because we sold our house and have to find a new one plus pack. However, I will want to set up in my new house once we move. I have not used the ic208 very much so far. Is there an online tutorial for it anywhere? Thanks!

301. Programming "four digit" frequencies?

Yahoo group: ic208h
Date: 2011-08-06 02:42:25 UTC
From: AlainMichel
Topic: 301 Message: 301

Hi All,

As a member of a local C.E.R.T. group, I'm in the process of programming my 208H with local, state and federal frequencies; almost all are for fire related agencies. I'm using my rig for a base unit currently.

While programming the rig today with the ICOM software, I found that I could not program 151.2725 (AM), but had NO problem programming 151.2875 (AM)!

I have tried all of the "steps" from 5Kc through 200Kc without success. The software will not permit the "four digit" frequency to be programmed.

Is there something I'm missing?

Many thanks for taking the time to reply!

Alain

Topic: 301 Message: 302

Use the 12.5kc step, it will show 151.272 and not the 4th decimal place. Our local police use 12.5kc steps, and it's not a problem.

Hi Luke,

I used the 12.5 kc step and it does not display

Why should the software permit the "151.2875" but not the "151.2725"?

The above two freqs are "air tac" frequencies. Both are FM.

I still do not understand why one frequency, 150 Kc away from the other is permitted and the other is not!

Alain

I just tried it on mine and it accepted the input. I wrote it to the radio
and it shows in the display. What version of the software are you using?

Hi Randy,

My software which came with the rig says:

"CS-208...Revision 1.0...Copyright 2003"

Why can you input the frequency and not Luke or I?

Are you using the 5 Kc or 12.5 Kc spacing?

From: Jeff
Topic: 311 Message: 311

Even though I have a General I don't really know much about the technology, so you can speak to me as if I know nothing. So here is what my set up looks like. I have the display unit, mic, and speaker up on my dash board. The actual unit is in the trunk of my sedan. I am using a CSB790a antenna. Even though I know you're not suppose to do this I do have the extra length of the antenna wire coiled up in the trunk. I don't want to cut the wire until I'm sure I know how to properly tune the antenna(which is why I'm here).

OK so here is my problem. I'm trying to access a repeater for the first time actually I'm trying to contact anyone for the first time with this radio and on 2 meters(That shows you how un-active I am but I'm changing that or trying too). With this set up I can hear station up to about 20 miles away. Now when I transmit I can get the repeater to send me the tone notifying me the message was received. For some reason though People can't hear me. They say there is practically no audio.

Also for you're mobile setups do you guys use antenna tuners and what's a good distance for a mobile setup, like how far should I be able to receive and transmit a successful contact on 2 meter?

Thanks for any help

Thanks for the workaround. I will have to use the toothpick for now. But for those who are similarly situated - here are the part numbers for replacement:

The button is part number 8930059740 the price is $3.35 you will also need the spring part number 8930006440 the price is $0.21

The ICOM parts support number is 1 800 346 0495

Just ordered the replacement parts.

327. Dual Access Tones - TX and RX different

Yahoo group: ic208h
Date: 2012-04-05 20:07:17 UTC
From: John
Topic: 327 Message: 327

Hi all,

I've searched around this group and on the internet looking for the answer to my question without success.

I have need to access a repeater using the following:

TX - D223 (DPL)
RX - 186.2 (standard tone)

Is there any way to do this with the ic-208H? I'd even be happy to go with carrier squelch on receive and use the DPL to access the machine if that's even possible. Obviously, I'd like the option for RX tone squelch.

Am I out of luck?

Thanks,
John

332. ICF File?

From: vk6vtp
Topic: 332 Message: 332

Hi All,

I wonder if anyone would be kind enough to mail me or point me to an ICF file that has the VK6 (Or Aust wide) repeaters configured, and ideally the 80 CB channels too? Just going to save a lot of typing....

Thanks in advance.

333. Programming "alpha tags" w/o HM-133 mic or software

Yahoo group: ic208h
Date: 2012-08-27 22:22:27 UTC
From: AlainMichel
Topic: 333 Message: 333

Hi All,

I have not been able to get the "alpha tag" to display in a new channel I've programmed in, despite following the directions on page # 31.

The bottom of this page shows what occurs when you follow the directions. See the photo in the middle on the bottom of the page. It says "CLUB"?

Well, the last window shows the display showing "144.580".

Welll, I don't want the frequency to show, I want the "CLUB" to show. I've gotten a new laptop and I cannot get the software to work, so am having to program the rig manually.

Anyway, the question I am placing before you is...how do I get the alpha tag to display and NOT the frequency?!

Many thanks for taking the time to respond!

Alain

334. IC-208H Problem with Hidden Menu

Yahoo group: ic208h
Date: 2012-09-14 16:27:11 UTC
From: James
Topic: 334 Message: 334

Well it's like this, I think the idiot who had my 208 before me got into the hidden menu in order to change the VHF and UHF power. They had no test equipment, screwed it up, then sold it to me. The problem now is that I sent it out for a proper alighnment (ICOM), and they have reset almost everything to factory specs "BUT" cannot get the pwer settings to take in either the VHF or UHF sides. Now I have a broken radio that will not set up in order to get it back to me. After talking to the tech, he stated that my radio is not the only one who is having this problem. Does anyone know any sort of fix for this problem. The 208 seems to be a great performer until people start playing with them, not knowing what their doing. H E L P

337. 208H Key-Touch Beep

Yahoo group: ic208h
Date: 2013-01-05 22:11:18 UTC
From: Dale Martin
Topic: 337 Message: 337

Just subscribed to this listgroup. Also, just bought a used IC-208H.

I have tried without success to figure out how to turn off the Key-touch Beep (p61-62 of the manual).

I tried Entering initial set mode (p61).

Step one says to hold Set-lock and press PWR (>1sec). This resulted in all memories being cleared ("CLEAR" in caps on-screen). I never got to see the Initial Set Mode Items (p61) on the screen. And trying step 2 resulted in only seeing the normal set mode items (p56).

Can anyone offer any advice on how to do this?

338. IC-208H S.MW-MW Button

Yahoo group: ic208h
Date: 2013-01-07 05:10:30 UTC
From: Dale Martin
Topic: 338 Message: 338

Success.

I took off the radio head, removed the two screws holding the mounting bracket to the head, removed the two screws holding the PC board to the head, removed the two knobs (vol & sql) and the circuit board came out nicely.

After a little fiddling with a surgical knife around the switch button, it was freely moving when depressed with a definite tactile click.

I put everything back together and did a Set-lock + Pwr to enter initial set mode and I was able to step through the menu and make the changes I had wanted to make.

Sometimes, things work out.

Following-up on my inquiry below, I believe I found the problem, thanks to Luke/VE3LDJ on the ICOM_MOBILE-RADIOS listgroup.

He suggested I turn off the radio and cycle the S.MW-MW button a number of times and then try the SET-LOCK + PWR Initial Set Mode power up function again.

It turns out that the S.MW_MW button is apparently stuck closed.

There was no significant button movement or tactile 'click' as with the SET-LOCK button, so I believe the S.MW_MW switch is closed -- which would explain the "CLEAR" screen message when I did the Set-Lock + PWR power-up.

The closed switch was the 'third man' in the ALL RESET function--clearing settings and memories.

I'm going to see if I can get into the radio head and maybe free up the switch. If not, I guess I'm hosed in this regard. I seriously doubt Icom supports this radio any more.

From: Dale Martin
Topic: 337 Message: 343

Sent 1/6, received 1/25. curious.

At any rate, if this gets through quickly, here's what I found out about the closed switch situation.

I removed the radio head from the unit, removed the knobs, removed the screws and got the circuit board under a magnifying glass.

Using a surgical knife, I gently worked at the periphery of the micro-sized push-button. It was, indeed, stuck in the depressed position.

I kept pushing at the 'button' and gently working the knife around the button's edge. Suddenly, it was free and operating as it should.

I packed it all back together and tried it out.

It worked. I can now get to the menus properly.

it's nice when things work out.

Hi All,

Question about scanning bands.

I know how to manage scanning singular bands. I also know how to scan ALL bands, but I do NOT yet know how to scan MORE than ONE band at a time, ignoring those I do not require.

Can anyone please tell me [step by step, please!], how to negotiate scanning more than one band...say, Bands A, B, D and F, for starters.

All assistance will be most gratefully received!

Many thanks for taking the time to respond,

Alain

Hello Alain,
If you are referring to Banks, check the bank link on function in the manual, that may help. If you really mean Bands, you MAY be able to disable bands via the factory setup menu, not sure about that one.

Good Luck,
-Luke

Need a Mounting Bracket, can anyone help to source them in the UK as Us sellers are not exporting at present or replying to my emails.

348. Extendid mic lead

Yahoo group: ic208h
Date: 2013-07-16 22:54:52 UTC
From: themuffins22a
Topic: 348 Message: 348

The microphone socket on the radio looks to me to be the same as a RJ45 if so can I use an Ethernet cable with a suitable coupler to extend the microphone lead. For members information I have just used CS-208 software which is freely available on internet to program radio albeit rather tedious exercise - no copy and paste but I did find it easier than using the radio/mic to do so. Also found Icom UK very helpful in finding an alternative Mounting Bracket as the one for the 208H is no longer available.

I use a CAT 5 cable for the mic extension without problem for years. Give it a try as CAT 5 cables are not expensive.

Topic: 354 Message: 354

I'm planning to install my 208H in a 2002 Chevrolet Suburban this weekend. Can anyone recommend a good mounting location for the base? I'm thinking about under the drivers seat, connected to the front cross-member of the seat frame, but I'd like to hear if anyone knows of a better location.

Also, a good location for the head? I would like to keep the head off the dashboard (Texas heat NOT GOOD for anything left on the dashboard!) The previous owner of this radio had his mounted on the steering column (chevy truck) with velcro. Any other ideas?

My head unit is on the overhead console in a Monte Carlo - write up at
<http://www.barovelli.com/projects/car/montehamradio.htm>
http://www.barovelli.com/projects/car/montehamradio.htm

Radio box is under the passenger seat because the OEM antenna and
power/control cables determined that it was the best choice.

Couple of updates not on the page - I later permanently secured the head
mount to the console with nuts & bolts. Also put the speaker up behind and
to the right of the rearview mirror with double sided tape on the windshield
- might not work in TX.

Leon,

My wife and I have been traveling quite a bit recently. Whether it's a hotel/motel/rental car agency or whatever, they will, invariably, take you to the airport in their "shuttle van."

I have noticed that everyone of the vehicles we have ridden in, has their ICOM/Motorola radios mounted in the vertical position on the fire wall...with the heat sink fins facing out.

When the A/C is running, some of the cool air strikes the rig which is a good thing. When the driver open the side door, air enters the cab as well.

You could make/purchase a "swing latch" that secures the rig and unhitch it when you are leaving the vehicle, for security reasons, then hide the unit under the seat.

I'm not totally sold on placing the unit under the seat. Don't think that it would get much air circulation down there...do you?

Something to think about...

Alain

Topic: 359 Message: 360

What I do is not exactly what you are after...

Press the "MONI/DTMF" button on the R.H. side of the display.

It will [in 2 meter mode] display the frequency on the input. You can then add "+" OR subtract "-" 0.600 to get the operating frequency.

On 440 MHz, you can just subtract 5.000

Anyway, that's how I do it...

From: <opalockamishabob@...>
Topic: 361 Message: 362

You didn't tell us what it is that you wanted the program to "do", other than to "turn this off". There is no "off" that I'm aware of.

You can refer to the "scan resume timer" on page #45 or #59 in the manual for other choices. Each page addresses this subject.

OR...

push "set lock" to enter "set" mode
push it several times until SCT or SCP appear.
rotate the dial to set the timer you want the scanning part to set.

SCT 15 scan pauses 15 seconds while receiving
SCT 10
SCT 5
SCP 2 pauses the scan until the signal disappears then resumes scanning 2 seconds later.

I use the SCP-2 exclusively.

push "MONI-DTMF" to exit

Hope this answers your question.

Alain

From: <jhancock1@...>
Topic: 364 Message: 364

Radio is about 7 years old and has seen moderate use. It sat in a car I haven't driven in 3 years. Last 2 weeks it worked OK. Tonight I turned it on and only heard a little "blip" and it went dead. Blew the fuse in the negative lead. It's a direct connection to the battery about 15' long #12. Replaced the main radio unit with another and it works so I know the wiring and control head is good.
Initial inspection doesn't show any obviously bad components on the board. No signs the magic smoke left.
Any ideas?

From: <jhancock1@...>
Topic: 364 Message: 366

That was my first guess also bu the inside of the radio looks new. It didn't blow the replacement fuse so whatever went must have opened. I'm thinking one of the voltage regulators may have shorted then opened. I have the service manual and tools I need. I was just hoping it was a common problem. I guess I have a weekend project

367. Re: [ic208h] Radio died

Topic: 364 Message: 367

Bad news. It works again. Now I may never know what happened. I slid the control head connector on and off three times while checking voltages and it came back. The contacts look clean and I had 13.8 volts at the connector. I doubt dirty contacts there would have taken out the fuse unless it was a coincidence they went at the same time. Oh well, until it goes again.
Thanks,
KB3ICM

Found a problem in the car grounding system. Bad connection on the ground terminal intermittently would open and all car ground current would flow through the radio ground and blow the fuse.

Trying to program the "A-1" and A-2" channels for railroad scanning. The manual instructions don't seem to be working from page # 42. I assume that "A-1" gets one frequency and "A-2" gets the other, correct?

Where does the "P-1" come into the display. I don't see it when I am programming the high-and-low ends of the freq's I'm trying to scan?

Many thanks!

Alain

373. IC-208h won't power on anymore

It's my fault, I fiddled.

Radio was working fine, then I attempted to DIY a remote head cable as they can't be purchased any more.

Long story short, after trying my funky cable, the radio won't power on any more (even without cable), so assume some pins shorted one of the other lines perhaps. Checking the schematic, there are no fuses in the head or protection diodes that I can see to check.

I did find one post on the net where the poor chap had the same issue after a dog ate through the extension cable, but he didn't mention how or if he fixed it.

Has anyone else seen this happen, or able to offer a next steps to try?

Ta,

Lance

If anyone has a OPC600 / 601 separation cable they don't need for the IC-208h, even if it's broken, I would love to hear from you, wherever you are in the world!

Does anyone know if the Icom CS-208 cloning software will work on the Windows 10 O/S?

My W7 machine is having fits with the April 2016 MS updates, and I will have to lgo back to a fresh install of W7 or upgrade to W10.

TIA

N9KO

383. Scan Question

I have a question regarding scan on the 208H, I have 3 radio's all doing the same thing, some frequencies stop on scan and some don't, I checked sensitivity on all the memories and they are all pretty well the same so the radio is not deaf at those frequencies. I have also tried it with no other settings apart from the memory frequencies but still the same result, has anyone else noticed this?
Thanks

Regards - Tony Eagling Vk7YBG

384. Squelch open with no signal

This is a new symptom. When there is no signal, the only way I can close the squelch is to rotate the knob to attenuate (past 12 o'clock).

I have been doing some internal wiring to add mini TRRS ports to enable remote mounting the head unit without the custom Icom cable. I'd like to explore if there are any other potential issues before I undo all my work.

I have reset the unit.

The only troubleshooting I've been able to manage is that when I engage narrow mode, it all operates correctly. And no, this is not a long term solution ;)

Any ideas would be appreciated.

385. DIY / homebrew separation kit - instructions.

Hi Group,

After a long search for a separation cable that didn't break the bank, with limited success, I made my own.

I've documented the process at
http://lance.conryclan.com/home/diy-icom-ic-208h-remote-head-cable/
http://lance.conryclan.com/home/diy-icom-ic-208h-remote-head-cable/ for the archives and anyone interested.
